

# AN EXPERIMENT: OPTIMIZING LSTM MODEL FOR STOCK PRICE (TESLA) PREDICTION

Forecasting Tesla's next-day stock price using LSTM model

Team Members:

→ BEN, BUT, CHARLES, HAZEL

Start Presentation

# PROJECT OBJECTIVE

## Objective:

To develop an LSTM model for predicting Tesla's next-day stock price by experimenting with input windows, epoch sizes, and LSTM layer configurations to determine the optimal setup for accurate prediction.

## Key Questions:

- Can an LSTM model accurately forecast Tesla's next-day stock price?
- What is the optimal combination of parameters for predicting Tesla's next-day stock price?
- Are there any overfitting risks with certain configurations? How can they be mitigated?
- Does the LSTM outperform a naive forecast?

# DATASET OVERVIEW

- Stock: Tesla
- Data Source: Yahoo Finance
- Time Period: 2014 to 2024 (01/01 to 31/12)
- Features Used: Date, Close Prices  
(Daily(trading day))
- Target Variable: Closing price (next day)

**yahoo!**  
**finance**

# LSTM MODEL OVERVIEW

## Why LSTM?

- Designed for sequential data (time series)
- Capture temporal dependencies across multiple time steps
- Suitable for stock price prediction due to its ability to model long-term trends

## Model Architecture:

- Recurrent Neural Network(RNN) Model
  - Forget Gate, Input Gate, Output Gate
- Steps:
  - 1 Looks at past info and new data (past stock price).
  - 2 Forgets unimportant things.
  - 3 Remembers useful new information.
  - 4 Gives an output (predicting tomorrow's price).

# METHODOLOGY

## Data Preparation:

- Extract and Preprocess Data from Yahoo Finance
- Missing & Null Value Checking
- Rescaling (min-max normalization): Rescaling the range of features to scale the range in  $[0, 1]$
- 80%-Training, 20%-Validation

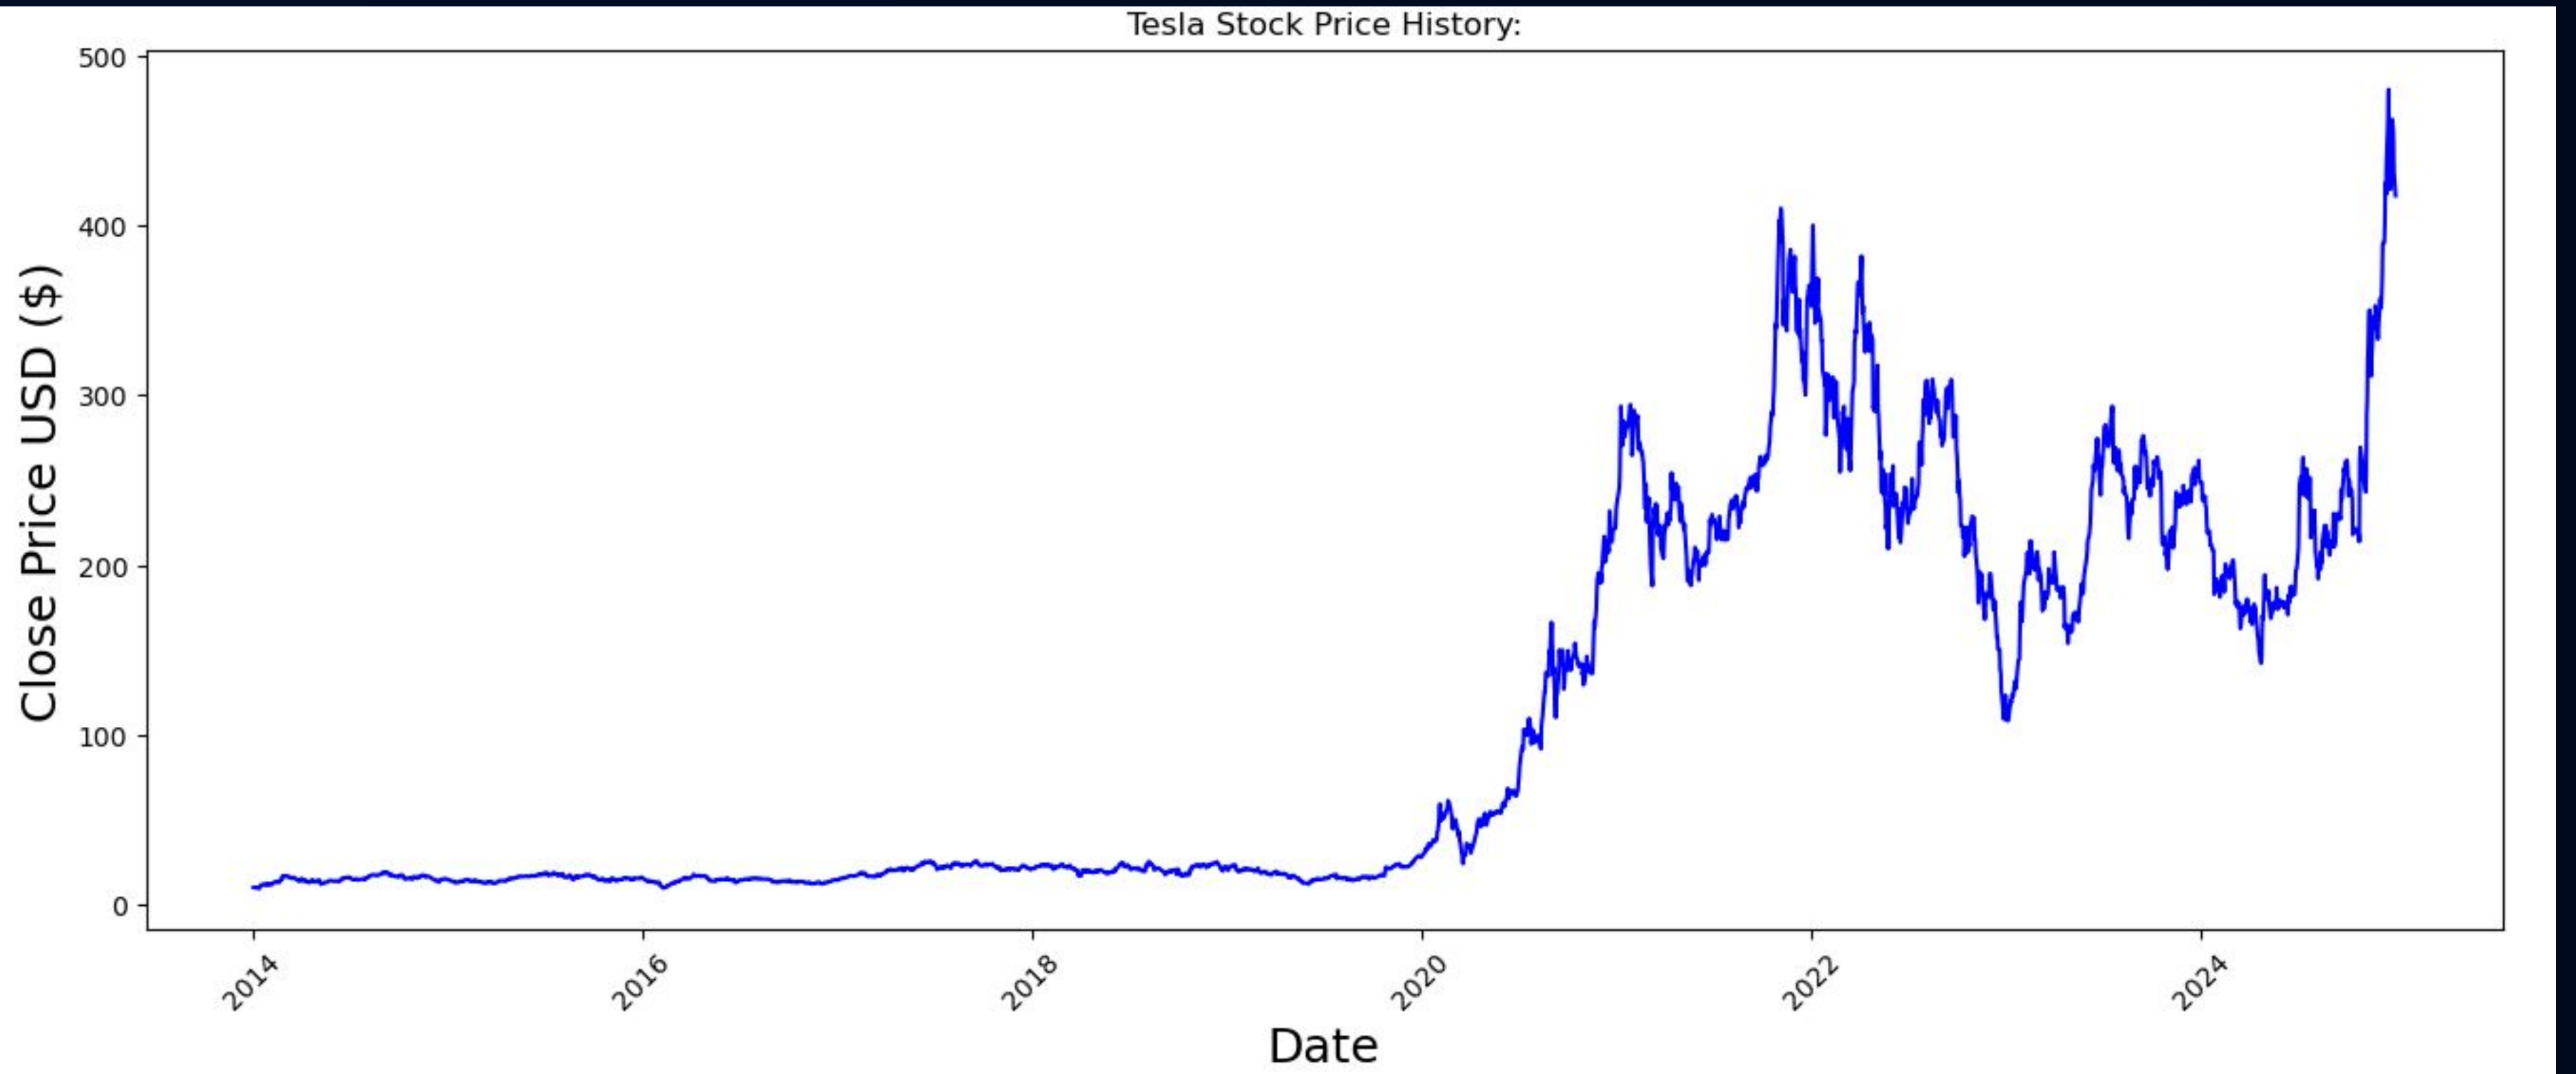

## LSTM Settings:

- Input window size (60, 30, 10, 5), next day's price as the target
- Layer Setting:
  - 1st Layer: 128; 2nd layer: 64
  - 1st Layer: 256; 2nd layer: 128
  - 1st Layer: 512; 2nd layer: 256
- Epoch Setting:
  - 50, 1000 Epoch
- Batch Size: 32
- Dropout Layer: 20% dropout
- Dense Layer: 25  $\rightarrow$  1 units

## Evaluation Metrics:

- $R^2$  Score
- Mean Absolute Error (MAE)
- Mean Squared Error (MSE)
- Root Mean Squared Error (RMSE)
- Comparison with naive forecast

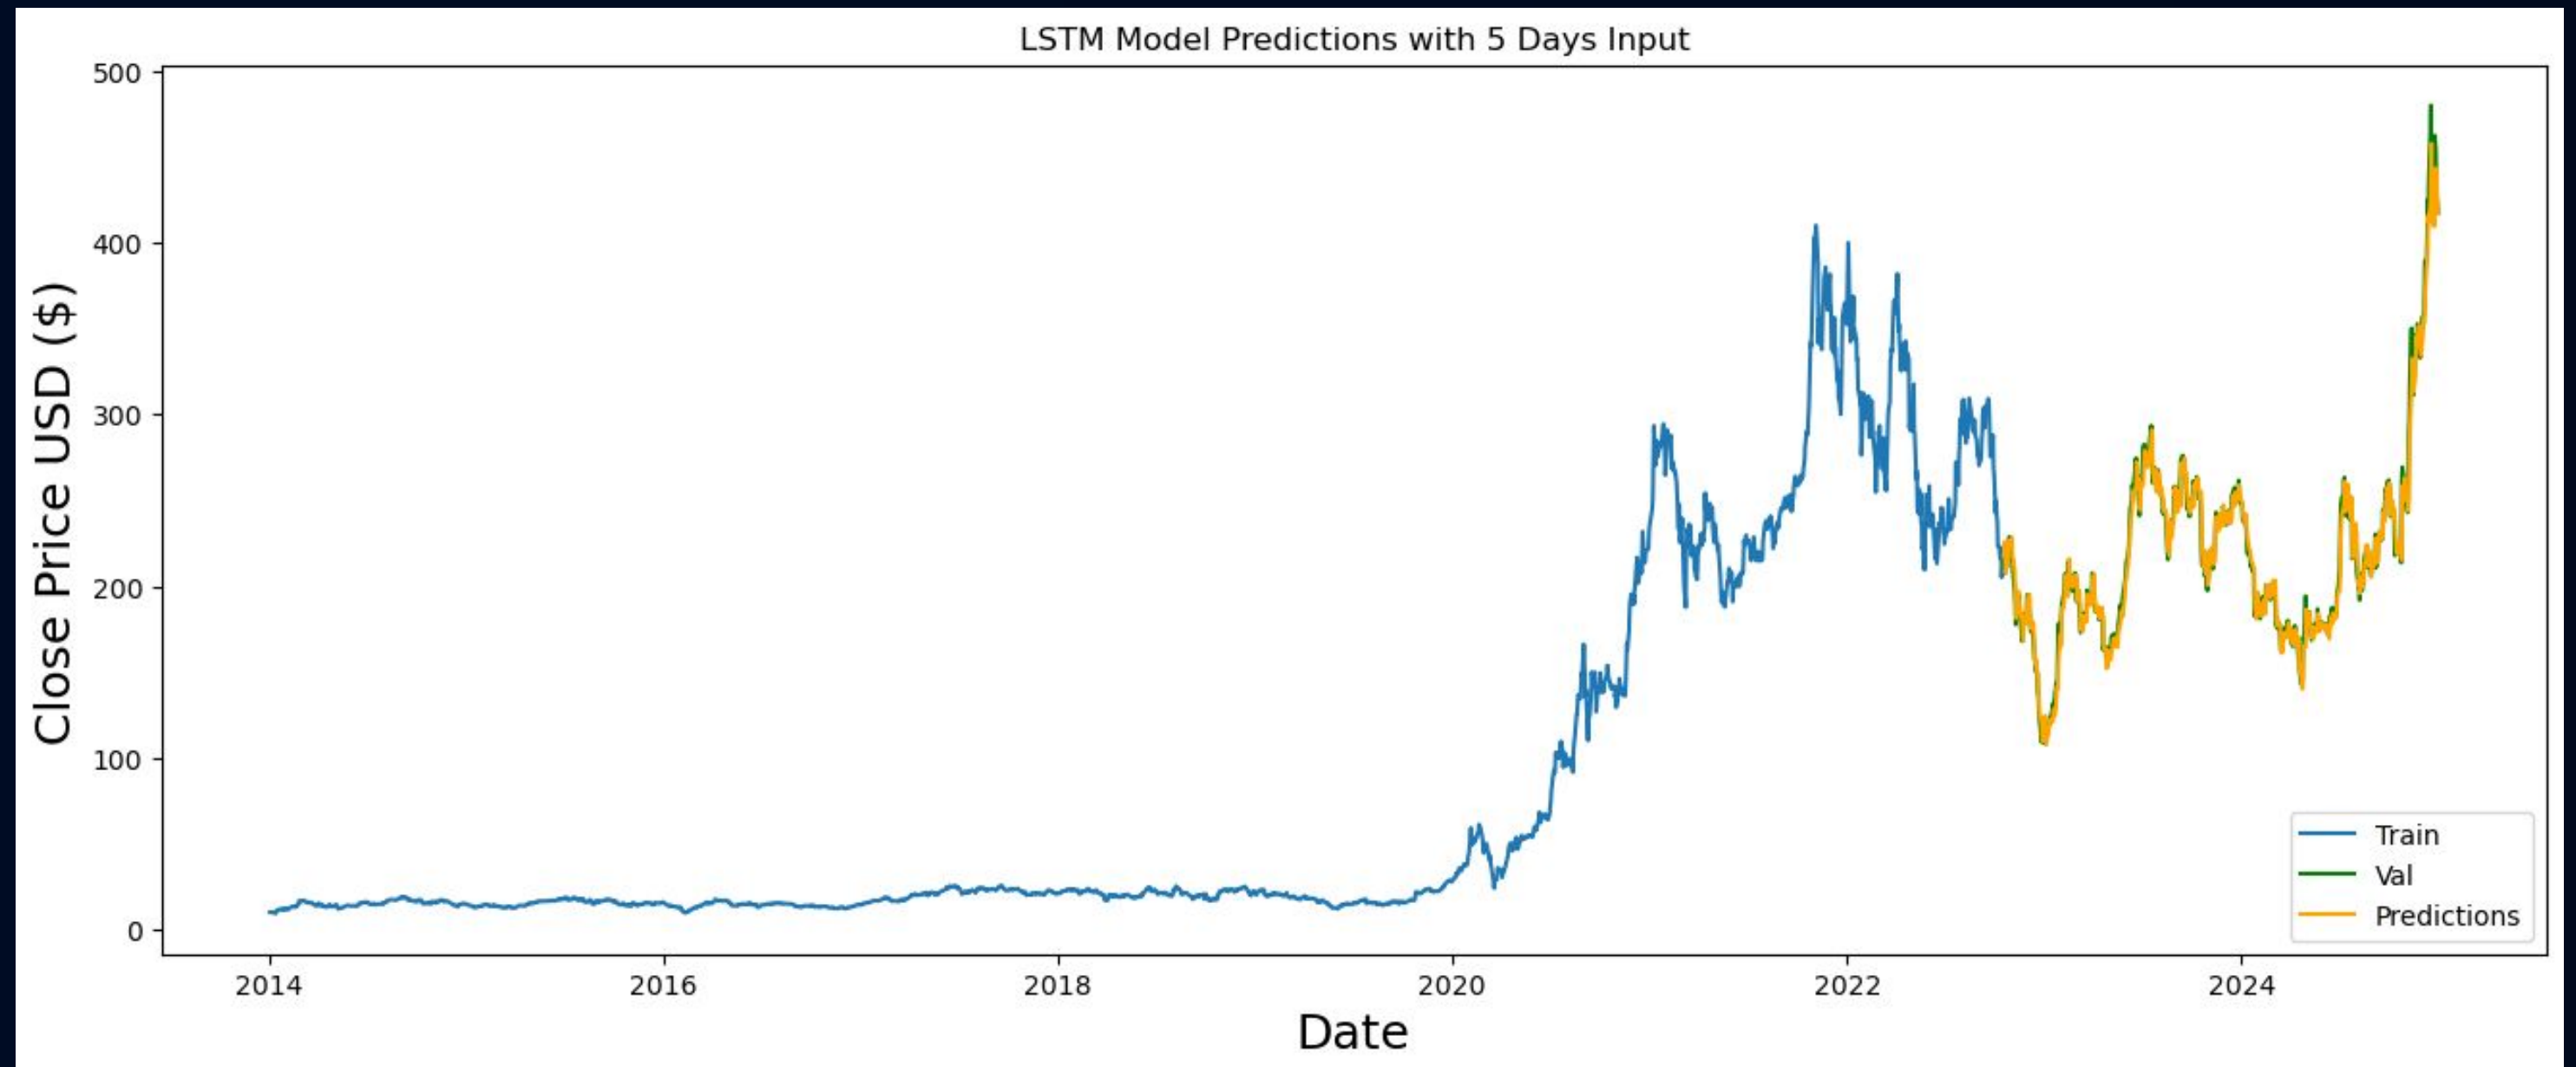

# TESLA STOCK PRICE HISTORY

# EXAMPLE

- LSTM: 512/256 Layer
- Epoch: 1000
- 5 Days Input

# EXAMPLE

- LSTM: 512/256 Layer
- Epoch: 1000
- 5 Days Input

# RESULT: LSTM 128/64

	Input Days				
Epoch : 50		60	30	10	5
	R <sup>2</sup> Score:	0.7428	0.7510	0.6488	0.7722

# SECTION SUMMARY

- Best Settings:
  - Use 1000 Epoch Instead of 50 Epoch
  - Use 5 Days or 60 Days for Prediction
  - No Obvious Difference in the Size of LSTM Layer
- Best Result in this Training:
  - LSTM 512/256
  - 5-Days

Predict Stock Price on 01/01/2024:	\$404.76
Naive Forecast:	\$417.41
Actual Stock Price:	\$379.28

# FURTHER EXPLORATION

- Overfit Validation

- Use RMSE from Performance Metric instead of Loss Function

- Code:

```
if train_rmse < test_rmse * 0.8:
```

```
    print("⚠ Overfitting detected! Consider adding dropout or reducing LSTM units.")
```

```
elif train_rmse > test_rmse * 1.2:
```

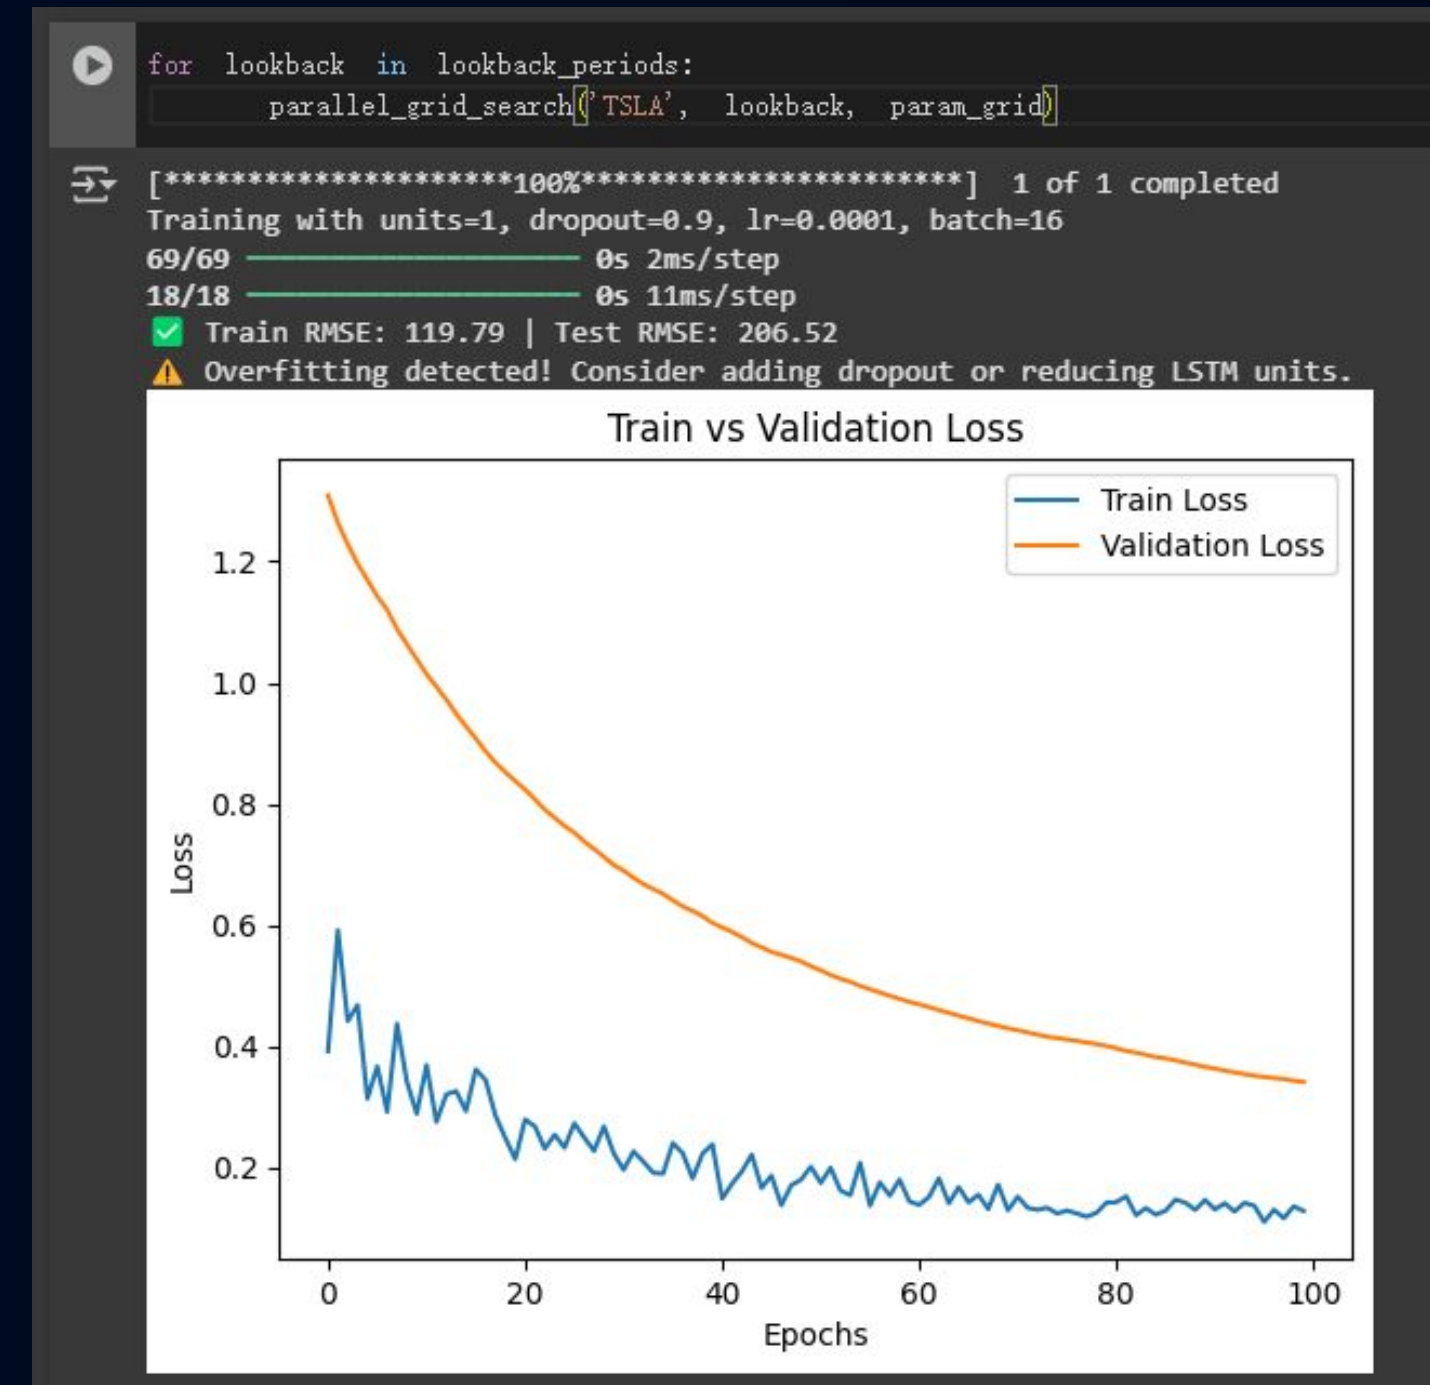

```
    print("⚠ Underfitting detected! Consider increasing LSTM units or learning rate.")
```

```
else:
```

```
    print("✅ Model is well-fitted.")
```

- All Result in Overfit by Adjusting:

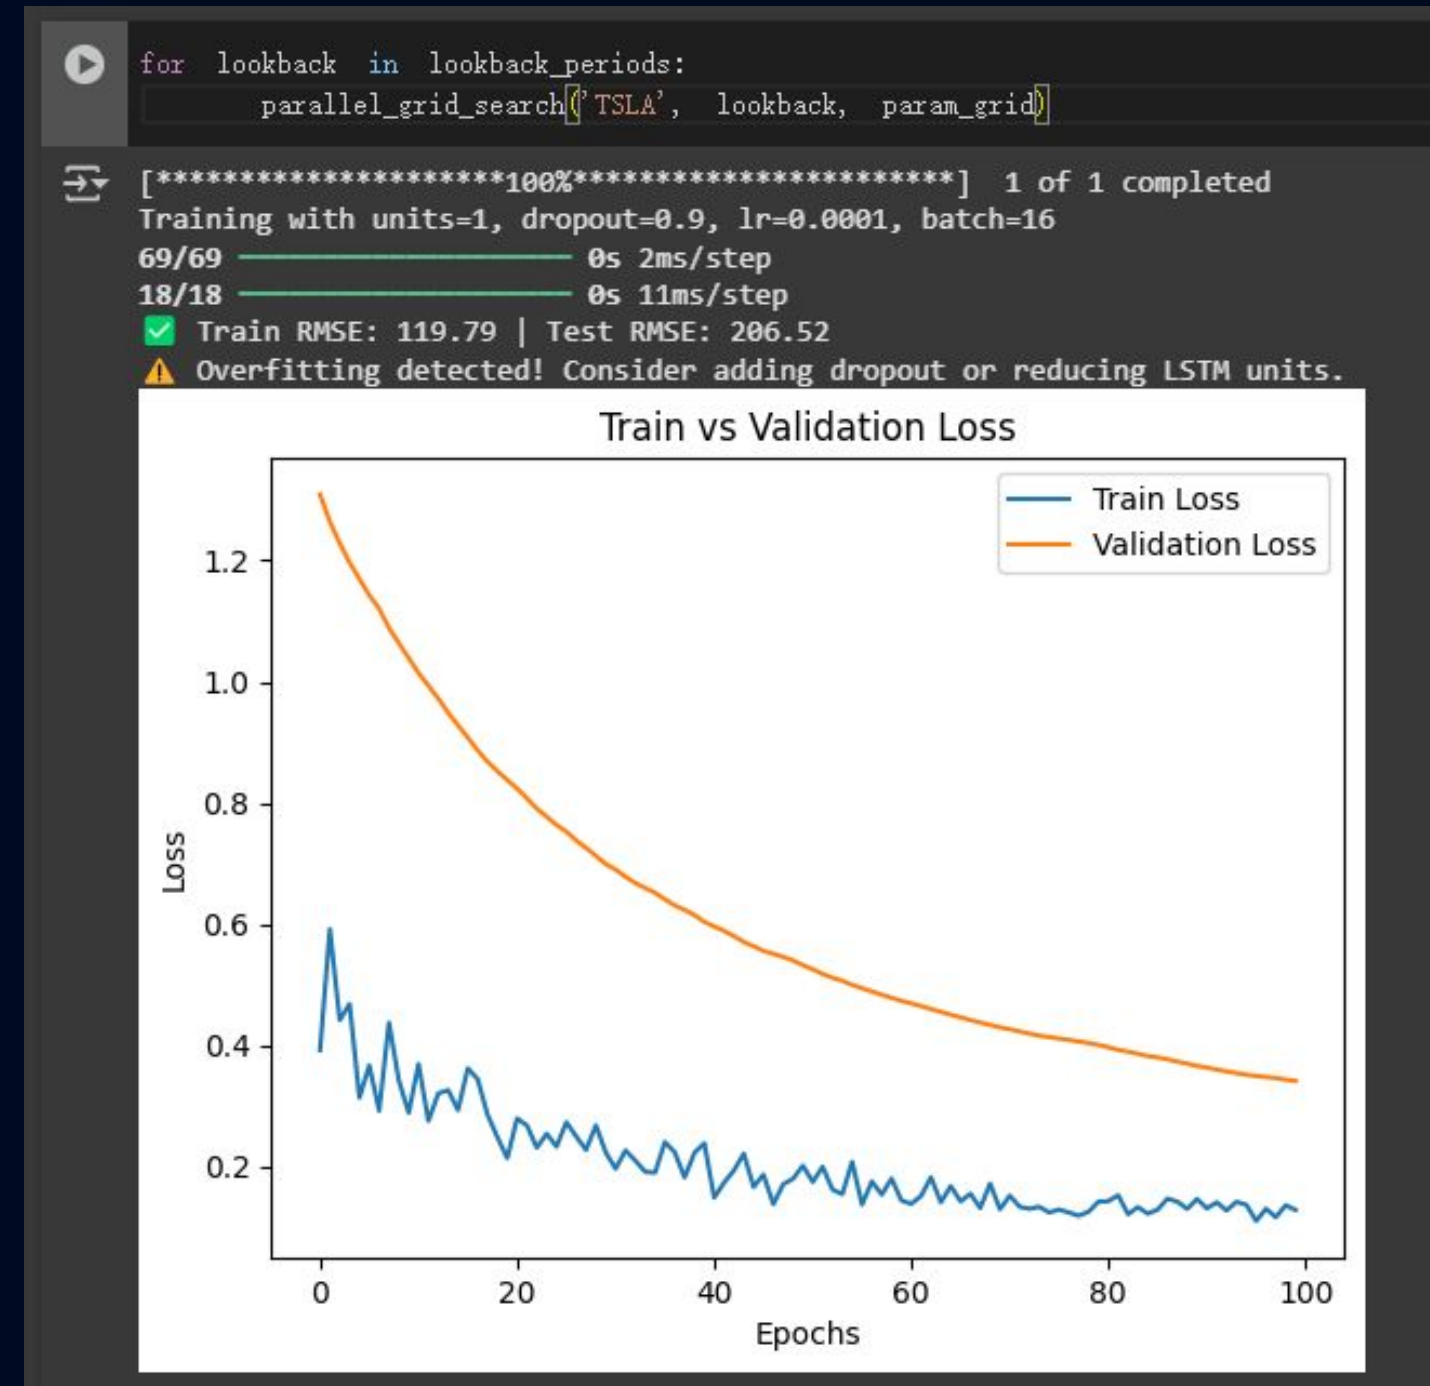

- No. of Units
- Lookback Day
- Dropout Rate
- Learning Rate

# SUMMARY

- Good Model for Stock Price Prediction
  - Limited to Historical Data
- Overfitted Model
  - Room for Refinement to be Well-fitted

# CHALLENGES & LIMITATIONS

## Challenges Faced During the Project

- Time Constraints
- Limited LSTM Familiarity
- Overfitted Model
- Computing Power

## Limitations of the Approach or Dataset

- Only based on historical data
- Simplified Assumptions
- Unverified by Different Stocks

## Potential Areas for Future Improvement

- Incorporating External Factors (e.g. Economic Indicators)
- Adjust Parameters to Early Stop Before Overfit result
- Compare Result via Different ML Models

## **DISCLAIMER**

***Stocks, Futures and options trading involves substantial risk of loss and is not suitable for every investor. The valuation of futures, stocks and options may fluctuate and as a result, clients may lose more than their original investment. The impact of seasonal and geopolitical events are already factored into the market prices. The highly leveraged nature of futures trading means that small market movements will have a great impact on your trading account and this can work against you, leading to large losses or can work for you, leading to large gains. If the market moves against you, you may sustain a total loss greater than the amount you deposited into your account. You are responsible for all the risks and financial resources you use and for the chosen trading system. You should not engage in trading unless you fully understand the nature of transactions you are entering into and the extent of your exposure to loss. If you do not fully understand these risks you must seek independent advice from your financial advisor.***

***All trading strategies are used at your own risk.***

An Experiment: Forecasting Tesla's next-day stock price using LSTM model

# THANK YOU

FOR YOUR TIME & SPECIAL THANKS TO OUR DEAR TEAM!
